

Turnkey Cogeneration Consultancy

Vy Consult can provide extensive services in setting up a cogeneration plant. Details of these services are given in the preceding pages. *Vy Consult* can provide services based on a “**Step**” basis where the next step of the project is undertaken if the client gives the “**Go Ahead**” or if the economics of the project are favourable.

For instance, if it is found in the feasibility study stage that the project is not viable, the client does not have to proceed to the next step and spend further funds on engineering. Even if the project is not viable, the client knows this and has a report to back it. In some cases, the project is not viable due to some unfavourable driving parameters (i.e. gas cost, currency exchange rate) and the client has a clear idea of what level has to be achieved to justify further investment into the project.

The diagram below summarizes the steps to cogeneration.
